

Customer Intelligence Platform

Project summary and page-by-page guide · October 2026

1. What the project is

The Customer Intelligence Platform is a dark-themed telemetry console for enterprise B2B **Customer Success and Retention teams**. It gives a Customer Success Manager (CSM) one place to see which accounts need attention, why, and what to do next. It follows the **Obsidian Telemetry** design system from Stitch.

The guiding principle is *"If you can't act on it, don't show it."* Every view pairs data with a reason and a next action, such as triggering a playbook, scheduling a review or exporting a briefing.

15

accounts loaded from the source document

7

views reachable by URL hash

4

modals (Ask AI, Playbook, Export, Seat Optimizer)

13

API endpoints

2. How it is built

Layer	Details
Frontend	React with Vite (<code>client/</code>). Hash-based navigation with no router library. Tailwind styling through a CDN config, Inter and JetBrains Mono fonts, and hand-written SVG charts.
Backend	Express on Node.js, ES modules (<code>server/</code>), on port 5001. The Vite dev server on port 5173 proxies <code>/api</code> to it.
Data	<code>server/data/accounts.json</code> , generated by Python scripts from <i>Customer_Intelligence_Account_Data.docx</i> (data as of Oct 5, 2026). <code>server/portfolio.js</code> derives every portfolio-level view from it.
Assessment engine	<code>server/assess/</code> . Rules for numbers and statuses plus a text tagger whose every tag carries a verbatim quote from the source record. It runs once at startup and makes no model calls.
Runtime state	Playbook triggers, feedback and assessment verdicts are held in server memory and reset on restart.

Data flow

`.docx` → Python tools → `accounts.json` → `portfolio.js` (portfolio, risk, notification and usage views) and `assess/engine.js` (assessments) → **Express API** → **React views**. `App.jsx` holds the current view, the selected account and the modals, and fetches data as the user navigates.

3. The pages

The sidebar offers Accounts Hub, Telemetry & Usage, Risk & Signals and Action Playbooks. The header adds Account Overview, Cases & History, Opportunities & Actions and Action Center. Each page has its own URL hash.

Account Detail — the account cockpit

`#detail` (default)

The flagship view for one account, chosen from a searchable breadcrumb dropdown. Cards include:

- **Header:** status, tier, ARR, renewal date and action buttons (playbook, export).
- **Basic Details and Contracts & Engagement:** TCV, region, customer since, AE, SE and renewal owner, plus contract and engagement facts.
- **Account Snapshot:** fiscal metrics such as ARR, YoY change and contract value.
- **Health Donut:** six-dimension health breakdown (usage, adoption, support, PS services, engagement, commercial).
- **Renewal Risk:** days to renewal and the active risk triggers.
- **Signals:** signal distribution and event log.
- **AI Assessment:** the engine's classification, severity, evidence quotes and drafts, where the CSM can mark a call confirmed, false positive or not useful.
- **Recommended Actions:** open prescriptions and playbook progress.
- **Telemetry Velocity Chart:** 90-day usage curve with a spike annotation.
- **Executive Summary:** narrative for QBR decks, with a feedback control.

Accounts Hub — portfolio dashboard

`#portfolio`

The triage page for a whole book of business. It shows aggregate KPIs (total ARR, average health, renewal ARR exposed, open prescriptions), a health breakdown donut (healthy, attention, critical), and an at-risk account list ranked by priority. The list can be searched and filtered, and clicking an account opens its Account Detail. A portfolio export is available.

Telemetry & Usage

`#usage-and-adoption`

Product usage as the most objective health signal. It has an account selector and the following parts:

- **Usage metric strip:** top-level usage KPIs.
- **Weekly usage trend chart:** multi-series SVG trend.
- **Product adoption grid:** module-level adoption heatmap.
- **Feature utilization table:** feature-by-feature usage with trends.
- **Adoption anomalies feed:** notable drops and shifts.

Risk & Signals — early warning system

`#risk-signals`

A KPI strip at the top, then four tabs:

- **Risk Overview:** sortable at-risk accounts table with health bars, plus a churn-probability matrix and top churn drivers.
- **Signal Feed:** reverse-chronological signals, colour-coded by severity, filterable by type and category, expandable, with contextual actions.
- **Escalations:** master/detail view with a severity-badged list and a threaded activity timeline with a reply box.
- **Expansion Signals:** expansion opportunities as a sortable table or a Kanban pipeline (Early Signal to Closed Won).

Cases & History

`#cases-and-history`

Support context for the selected account, with a summary strip and three tabs: **Case Queue**, **Account History** (timeline) and **Trends**. Side widgets show professional-services status, escalation details and an AI case summary.

Opportunities & Actions

`#opportunities-and-actions`

The commercial picture, with a summary strip and three tabs: **Opportunities** (list), **Expansion Details**, and **Renewal & Churn History**.

Action Center

`#action-center`

Turns insight into work. It lists per-account action steps grouped by team (Support, Executive, Renewal, CS, PS, Sales) that can be ticked off, and an **AI Triage Queue** that ranks accounts across the portfolio. It can also build and download an **Account 360** briefing.

Action Playbooks

`sidebar entry, not yet built`

The entry exists in the sidebar but has no page behind it. Full playbook management is on the roadmap.

Modals (available from any page)

Modal	Purpose
Ask AI	Question and answer about the active account. Answers come from the stored assessment and cite the records used.
Playbook	Shows playbook steps and an audit timeline, and dispatches the playbook.
Export	Executive briefing preview with cover page, metrics snapshot and recommended actions.
Seat Optimizer	Seat optimization view for the selected account.

4. API overview

Endpoint	Purpose
GET /api/accounts, /:name	Accounts Hub list (searchable) and the full account record.
GET /api/portfolio	Aggregate portfolio metrics.
GET /api/usage/:name	Usage and adoption data for one account.
GET /api/risk-signals	Risk summary, at-risk rows and signal feed.
GET /api/notifications	Header notifications and unread count.
GET /api/assessments, /:name	Assessment summary rows and a full assessment.
POST /api/assessments/:name/feedback	Record a verdict on an assessment.
POST /api/playbook/trigger	Dispatch a playbook.
POST /api/ask-ai, /api/feedback	Grounded Q&A and feedback capture.
GET /api/health	Health check.

5. What changed since v1.0

- Replaced the hand-written 3-account `data.js` with 15 real accounts generated from the source document, plus the Python tooling to regenerate them.
- Added the assessment engine, the assessment endpoints and an AI Assessment card, and made Ask AI answer from stored assessments.
- Added three views (Cases & History, Opportunities & Actions, Action Center) and the Seat Optimizer modal.
- Added Basic Details and Contracts & Engagement cards, and removed the Peer Cohort and Prescribed Actions cards.
- Merged the two READMEs into one and added `DATA_FIELDS.md`, which lists every field the UI displays.

6. Running it and what comes next

Install with `npm run install:all`, then start both halves with `npm run dev`. The app is at `http://localhost:5173` and the API at `http://localhost:5001`.

Next step	Why
Real database and persistence	Playbooks and verdicts currently reset when the server restarts.
Authentication and multi-tenancy	CSMs should only see their own accounts.
Action Playbooks page	The sidebar entry has no page yet.
LLM-backed text tagger	Replace the local tagger in <code>tagText()</code> ; the verbatim-quote check stays.
Live telemetry and notification center	Move from static data to pushed signals.
Mobile layout, light theme, full PDF export	The app is currently desktop-only and dark-only, and Export is a preview.
